Protected Attributes

- [TPVCmnEventType](#) iEventType
- [TPVCmnExclusivePtr](#) iExclusivePtr
- uint8 iLocalBuffer [PV_COMMON_ASYNC_EVENT_LOCAL_BUF_SIZE]

4.1.1 Detailed Description

[CPVCmnAsyncEvent](#) Class

[CPVCmnAsyncEvent](#) is the base class used to pass unsolicited error and informational indications to the user. Additional information can be tagged based on the specific event

4.1.2 Constructor & Destructor Documentation

4.1.2.1 CPVCmnAsyncEvent::CPVCmnAsyncEvent (TPVCmnEventType *aEventType*, TPVCmnExclusivePtr *aExclusivePtr*, const uint8 * *aLocalBuffer* = NULL, uint32 *aLocalBufSize* = 0, TPVCmnResponseType *aResponseType* = NULL) [inline]

References `iLocalBuffer`, and `PV_COMMON_ASYNC_EVENT_LOCAL_BUF_SIZE`.

4.1.2.2 CPVCmnAsyncEvent::~~CPVCmnAsyncEvent () [inline]

4.1.3 Member Function Documentation

4.1.3.1 void CPVCmnAsyncEvent::GetEventData (TPVCmnExclusivePtr & *aPtr*) const [inline]

Returns

Returns the opaque data associated with the event.

References `iExclusivePtr`.

4.1.3.2 TPVCmnEventType CPVCmnAsyncEvent::GetEventType () const [inline]

Returns

Returns the Event type that has been received

References `iEventType`.

4.1.3.3 uint8* CPVCmnAsyncEvent::GetLocalBuffer () [inline]

Returns

Returns the local data associated with the event.

References `iLocalBuffer`.

4.1.4 Field Documentation

4.1.4.1 TPVCmnEventType CPVCmnAsyncEvent::iEventType [protected]

Referenced by `GetEventType()`.

4.1.4.2 TPVCmnExclusivePtr CPVCmnAsyncEvent::iExclusivePtr [protected]

Referenced by `GetEventData()`.

4.1.4.3 uint8 CPVCmnAsyncEvent::iLocalBuffer[PV_COMMON_ASYNC_EVENT_LOCAL_BUF_SIZE] [protected]

Referenced by `CPVCmnAsyncEvent()`, and `GetLocalBuffer()`.

4.3.1 Detailed Description

CPVInterfaceCmdMessage Class

CPVInterfaceCmdMessage is the interface to the pv2way SDK, which allows initialization, control, and termination of a two-way terminal. The application is expected to contain and maintain a pointer to the CPV2WayInterface instance at all times that a call is active. The CPV2WayFactory factory class is to be used to create and delete instances of this class

4.3.2 Constructor & Destructor Documentation

4.3.2.1 [CPVCmnInterfaceCmdMessage::CPVCmnInterfaceCmdMessage](#) (int aType, OsclAny *aContextData) [**inline**]

4.3.2.2 [CPVCmnInterfaceCmdMessage::CPVCmnInterfaceCmdMessage](#) () [**inline**]

Referenced by GetType().

4.3.2.3 `virtual CPVCmnInterfaceCmdMessage::~CPVCmnInterfaceCmdMessage () [inline, virtual]`

4.3.3 Member Function Documentation

4.3.3.1 `int CPVCmnInterfaceCmdMessage::compare (CPVCmnInterfaceCmdMessage * a, CPVCmnInterfaceCmdMessage * b) const [inline]`

The algorithm used in `OsciPriorityQueue` needs a compare function that returns true when A's priority is less than B's

Returns

true if A's priority is less than B's, else false

References `iId`.

4.3.3.2 `PVCommandId CPVCmnInterfaceCmdMessage::GetCommandId () [inline]`

4.11 PVAuthorEngineFactory Class Reference

```
#include <pvauthorenginefactory.h>
```

Static Public Member Functions

- static OSCL_IMPORT_REF PVAuthorEngineInterface * CreateAuthor (PVCommandStatusObserver *aCmdStatusObserver, PVErrorEventObserver *aErrorEventObserver, PVInformationalEventObserver *aInfoEventObserver)
- static OSCL_IMPORT_REF bool DeleteAuthor (PVAuthorEngineInterface *aAuthor)

4.11.1 Detailed Description

PVAuthorEngineFactory Class

PVAuthorEngineFactory class is a singleton class which instantiates and provides access to pvAuthor engine. It returns an PVAuthorEngineInterface reference, the interface class of the pvAuthor SDK.

The application is expected to contain and maintain a pointer to the PVAuthorEngineInterface instance at all time that pvAuthor engine is active.

4.11.2 Member Function Documentation

4.11.2.1 static OSCL_IMPORT_REF PVAuthorEngineInterface* PVAuthorEngineFactory::CreateAuthor (PVCommandStatusObserver * aCmdStatusObserver, PVErrorEventObserver * aErrorEventObserver, PVInformationalEventObserver * aInfoEventObserver) [static]

Creates an instance of a pvAuthor engine. If the creation fails, this function will leave.

Parameters

- aCmdStatusObserver* The observer for command status
- aErrorEventObserver* The observer for unsolicited error events
- aInfoEventObserver* The observer for unsolicited informational events

Returns

A pointer to an author or leaves if instantiation fails

4.11.2.2 static OSCL_IMPORT_REF bool PVAuthorEngineFactory::DeleteAuthor (PVAuthorEngineInterface * aAuthor) [static]

This function allows the application to delete an instance of a pvAuthor and reclaim all allocated resources. An author can be deleted only in the idle state. An attempt to delete an author in any other state will fail and return false.

Parameters

- aAuthor* The author to be deleted.

Returns

A status code indicating success or failure.

4.12.1 Detailed Description

[PVAuthorEngineInterface](#)

4.12.2 Constructor & Destructor Documentation

4.12.2.1 `virtual PVAuthorEngineInterface::~PVAuthorEngineInterface () [inline, virtual]`

Destructor.

4.12.3 Member Function Documentation

4.12.3.1 `virtual PVCommandId PVAuthorEngineInterface::AddDataSink (const PVMFNodeInterface & aDataSink, const OsclAny * aComposer, const OsclAny * aContextData = NULL) [pure virtual]`

Adds a media sink where output data from the specified composer will be written to. Currently this API does not cause any action as it is not relevant.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. The referenced composer must be previously selected.

This command does not change the pvAuthor Engine engine state.

Parameters

aDataSink Reference to the data sink to be used

aComposer Opaque data identifying the composer to which the data sink will connect to.

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.2 `virtual PVCommandId PVAuthorEngineInterface::AddDataSource (const PVMFNodeInterface & aDataSource, const OsclAny * aContextData = NULL) [pure virtual]`

Adds a media source to be used as input to an authoring session.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. This command does not change the pvAuthor Engine engine state.

Parameters

aDataSource Reference to the data source

aContextData Optional opaque data to be passed back to user with the command response

Returns

Unique command ID to identify this command in command response

4.12.3.3 virtual PVCommandId PVAuthorEngineInterface::AddMediaTrack (const PVMFNodeInterface & aDataSource, const PVUuid & aEncoderUuid, const OsclAny * aComposer, PVInterface *& aConfigInterface, const OsclAny * aContextData = NULL) [pure virtual]

Add a media track to the specified composer.

The source data of this media track will come from the specified data source. pvAuthor engine will encoder of the specified Uuid to encode the source data. A media track will be added to the specified composer, and encoded data will be written to the composer during the authoring session.

A configuration object for the selected composer will be saved to the PVInterface pointer provided in aConfigInterface parameter. User should call queryInterface to query for the configuration interfaces supported by the encoder. Before calling [Reset\(\)](#), user must call removeRef on the PVInterface object to remove its reference to the object.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. The referenced data source and composer must be already added before this method is called. This command does not change the pvAuthor Engine engine state.

Parameters

aDataSource Data source node to provide input data

aEncoderUuid Uuid of encoder to encode the source data

aComposer Opaque data to identify the composer in which a media track will be added.

aConfigInterface Pointer to configuration object for the selected encoder will be saved to this parameter upon completion of this call

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.4 virtual PVCommandId PVAuthorEngineInterface::AddMediaTrack (const PVMFNodeInterface & aDataSource, const PvmfMimeType & aEncoderType, const OsclAny * aComposer, PVInterface *& aConfigInterface, const OsclAny * aContextData = NULL) [pure virtual]

Add a media track to the specified composer.

The source data of this media track will come from the specified data source. pvAuthor engine will select the most suitable available encoder of the specified type. A media track will be added to the specified composer, and encoded data will be written to the composer during the authoring session.

A configuration object for the selected composer will be saved to the PVInterface pointer provided in aConfigInterface parameter. User should call queryInterface to query for the configuration interfaces supported by the encoder. Before calling [Reset\(\)](#), user must call removeRef on the PVInterface object to remove its reference to the object.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. The referenced data source and composer must be already added before this method is called. This command does not change the pvAuthor Engine engine state.

Parameters

aDataSource Data source node to provide input data

aEncoderType MIME type of encoder to encode the source data

aComposer Opaque data to identify the composer in which a media track will be added.

aConfigInterface Pointer to configuration object for the selected encoder will be saved to this parameter upon completion of this call

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.5 virtual PVCommandId PVAuthorEngineInterface::CancelAllCommands (const OsclAny * aContextData = NULL) [pure virtual]

Cancel all pending requests. The current request being processed, if any, will also be aborted. PVAE_CMD_CANCEL_ALL_COMMANDS will be passed to the command observer on completion. Currently this API is NOT SUPPORTED.

Parameters

aContextData Optional opaque data that will be passed back to the user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.6 virtual PVCommandId PVAuthorEngineInterface::Close (const OsclAny * aContextData = NULL) [pure virtual]

Closes an authoring session.

All resources added and allocated to the authoring session will be released.

This command is valid only when pvAuthor engine is in PVAE_STATE_OPENED state and Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_IDLE state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

Unique command ID to identify this command in command response

4.12.3.7 virtual PVCommandId PVAuthorEngineInterface::GetLogLevel (const char * aTag, PVLogLevelInfo & aLogInfo, const OsclAny * aContextData = NULL) [pure virtual]

Allows the logging level to be queried for a particular logging tag. A larger log level will result in more messages being logged.

In the asynchronous response, this should return the log level along with an indication of where the level was inherited (i.e., the ancestor tag). Currently this API is NOT SUPPORTED.

Parameters

aTag Specifies the logger tree tag where the log level should be retrieved.

aLogInfo An output parameter which will be filled in with the log level information.

aContextData Optional opaque data that will be passed back to the user with the command response

Exceptions

memory_error leaves on memory allocation error.

Returns

A unique command id for asynchronous completion

4.12.3.8 virtual PVAEState PVAuthorEngineInterface::GetPVAuthorState () [pure virtual]

This function returns the current state of the pvAuthor Engine. Application may use this info for updating display or determine if the pvAuthor Engine is ready for the next command.

Parameters

aState Output parameter to hold state information

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for synchronous completion

4.12.3.9 static OSCL_IMPORT_REF void PVAuthorEngineInterface::GetSDKInfo (PVSDKInfo & aSDKInfo) [static]

Returns SDK version information about author engine.

Parameters

aSDKInfo A reference to a [PVSDKInfo](#) structure which contains product name, supported hardware platform, supported software platform, version, part number, and PV UUID. These fields will contain info .for the currently instantiated pvPlayer engine when this function returns success.

4.12.3.10 virtual PVCommandId PVAuthorEngineInterface::GetSDKModuleInfo (PVSDKModuleInfo & aSDKModuleInfo, const OsclAny * aContextData = NULL) [pure virtual]

Returns information about all modules currently used by the SDK. Currently this API is NOT SUPPORTED.

Parameters

aSDKModuleInfo A reference to a PVSDKModuleInfo structure which contains the number of modules currently used by pvAuthor Engine and the PV UID and description string for each module. The PV UID and description string for modules will be returned in one string buffer allocated by the client. If the string buffer is not large enough to hold the all the module's information, the information will be written up to the length of the buffer and truncated.

aContextData Optional opaque data that will be passed back to the user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.11 virtual PVCommandId PVAuthorEngineInterface::Init (const OsclAny * *aContextData* = NULL) [pure virtual]

Initialize an authoring session.

Upon calling this method, no more data sources and sinks can be added to the session. Also, all configuration settings will be locked and cannot be modified until the session is reset by calling [Reset\(\)](#). Resources for the session will be allocated and initialized to the configuration settings specified. This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state.

Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_INITIALIZED state, and the authoring session is ready to start.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.12 virtual PVCommandId PVAuthorEngineInterface::Open (const OsclAny * *aContextData* = NULL) [pure virtual]

Opens an authoring session.

This command is valid only when pvAuthor engine is in PVAE_STATE_IDLE state. Upon completion of this method, pvAuthor engine will be in PVAE_STATE_OPENED state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

Unique command ID to identify this command in command response

4.12.3.13 virtual PVCommandId PVAuthorEngineInterface::Pause (const OsclAny * *aContextData* = NULL) [pure virtual]

Pause the authoring session.

The authoring session will be paused and no encoded output data will be sent to the data sink. This function is valid only in the PVAE_STATE_RECORDING state.

Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_PAUSED state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.14 `virtual PVCommandId PVAuthorEngineInterface::QueryInterface (const PVUuid & aUuid, PVInterface *& aInterfacePtr, const OsclAny * aContextData = NULL) [pure virtual]`

This API is to allow for extensibility of the pvAuthor engine interface. It allows a caller to ask for an instance of a particular interface object to be returned. The mechanism is analogous to the COM IUnknown method. The interfaces are identified with an interface ID that is a UUID as in DCE and a pointer to the interface object is returned if it is supported. Otherwise the returned pointer is NULL. TBD: Define the UUID, InterfacePtr structures

Parameters

aUuid The UUID of the desired interface

aInterfacePtr The output pointer to the desired interface

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.15 `virtual PVCommandId PVAuthorEngineInterface::RemoveDataSink (const PVMFNNodeInterface & aDataSink, const OsclAny * aContextData = NULL) [pure virtual]`

Removes a previously added data sink. Currently this API does not cause any action as it is not relevant.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. This command does not change the pvAuthor Engine engine state.

Parameters

aDataSink Reference to the data sink to be removed

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.16 `virtual PVCommandId PVAuthorEngineInterface::RemoveDataSource (const PVMFNNodeInterface & aDataSource, const OsclAny * aContextData = NULL) [pure virtual]`

Unbinds a previously added data source.

This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. This command does not change the pvAuthor Engine engine state.

Parameters

aDataSource Reference to the data source to be removed

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.17 virtual PVCommandId PVAuthorEngineInterface::RemoveLogAppender (const char * aTag, PVLoggerAppender & aAppender, const OsclAny * aContextData = NULL) [pure virtual]

Allows a logging appender to be removed from the logger tree at the point specified by the input tag. If the input tag is NULL then the appender will be removed from locations in the tree. Currently this API is NOT SUPPORTED.

Parameters

aTag Specifies the logger tree tag where the appender should be removed. Can be NULL to remove at all locations.

aAppender The log appender to remove.

aContextData Optional opaque data that will be passed back to the user with the command response

Exceptions

memory_error leaves on memory allocation error.

Returns

A unique command id for asynchronous completion

4.12.3.18 virtual PVCommandId PVAuthorEngineInterface::Reset (const OsclAny * aContextData = NULL) [pure virtual]

Reset an initialized authoring session.

The authoring session will be stopped and all composers and encoders selected for the session will be removed. All data sources and sinks will be reset but will continue to be available for authoring the next output clip.

User must call removeRef() to remove its reference to any PVInterface objects received from [SelectComposer\(\)](#) or [AddMediaTrack\(\)](#) or [QueryInterface\(\)](#) APIs before calling this method. This method would fail otherwise.

This method can be called from ANY state but PVAE_STATE_IDLE. Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_OPENED state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.19 **virtual PVCommandId PVAuthorEngineInterface::Resume (const OsclAny * *aContextData* = NULL) [pure virtual]**

Resume a paused authoring session.

The authoring session will be resumed and pvAuthor Engine will resume sending encoded output data to the data sinks. This function is valid only in the PVAE_STATE_PAUSED state.

Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_RECORDING state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.20 **virtual PVCommandId PVAuthorEngineInterface::SelectComposer (const PVUuid & *aComposerUuid*, PVInterface *& *aConfigInterface*, const OsclAny * *aContextData* = NULL) [pure virtual]**

Selects an output composer by specifying its Uuid.

pvAuthor engine the composer of the specified Uuid in the authoring session. This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. This command does not change the pvAuthor Engine state.

Upon completion of this command, opaque data to identify the selected composer is provided in the call-back. The user needs to use this opaque data to identify the composer when calling [AddMediaTrack\(\)](#), [AddDataSink\(\)](#). A configuration interface for the selected composer will be saved to the PVInterface pointer provided in aConfigInterface parameter. User should call queryInterface to query for the configuration interfaces supported by the composer. When configuration is complete or before calling [Reset\(\)](#), user must call removeRef on the PVInterface object to remove its reference to the object.

Parameters

aComposerUuid Uuid of output composer to be used

aConfigInterface Pointer to configuration object for the selected composer will be saved to this parameter upon completion of this call

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.21 **virtual PVCommandId PVAuthorEngineInterface::SelectComposer (const PvmfMimeString & *aComposerType*, PVInterface *& *aConfigInterface*, const OsclAny * *aContextData* = NULL) [pure virtual]**

Selects an output composer by specifying its MIME type.

pvAuthor engine will use the most suitable output composer of the specified MIME type available in the authoring session. This command is valid only when pvAuthor Engine is in PVAE_STATE_OPENED state. This command does not change the pvAuthor Engine state.

Upon completion of this command, opaque data to identify the selected composer is provided in the callback. The user needs to use this opaque data to identify the composer when calling [AddMediaTrack\(\)](#), [AddDataSink\(\)](#). A configuration interface for the selected composer will be saved to the PVInterface pointer provided in aConfigInterface parameter. User should call queryInterface to query for the configuration interfaces supported by the composer. When configuration is complete or before calling [Reset\(\)](#), user must call removeRef on the PVInterface object to remove its reference to the object.

Parameters

aComposerType MIME type of output composer to be used

aConfigInterface Pointer to configuration object for the selected composer will be saved to this parameter upon completion of this call

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.22 virtual PVCommandId PVAuthorEngineInterface::SetLogAppender (const char * aTag, PVLoggerAppender & aAppender, const OsclAny * aContextData = NULL) [pure virtual]

Allows a logging appender to be attached at some point in the logger tag tree. The location in the tag tree is specified by the input tag string. A single appender can be attached multiple times in the tree, but it may result in duplicate copies of log messages if the appender is not attached in disjoint portions of the tree. A logging appender is responsible for actually writing the log message to its final location (e.g., memory, file, network, etc). Currently this API is NOT SUPPORTED.

Parameters

aTag Specifies the logger tree tag where the appender should be attached.

aAppender The log appender to attach.

aContextData Optional opaque data that will be passed back to the user with the command response

Exceptions

memory_error leaves on memory allocation error.

Returns

A unique command id for asynchronous completion

4.12.3.23 virtual PVCommandId PVAuthorEngineInterface::SetLogLevel (const char * aTag, int32 aLevel, bool aSetSubtree = false, const OsclAny * aContextData = NULL) [pure virtual]

Allows the logging level to be set for the logging node specified by the tag. A larger log level will result in more messages being logged. A message will only be logged if its level is LESS THAN or equal to the current log level. The set_subtree flag will allow an entire subtree, with the specified tag as the root, to be reset to the specified value. Currently this API is NOT SUPPORTED.

Parameters

aTag Specifies the logger tree tag where the log level should be set.

aLevel Specifies the log level to set.

aSetSubtree Specifies whether the entire subtree with aTag as the root should be reset to the log level.

aContextData Optional opaque data that will be passed back to the user with the command response

Exceptions

memory_error leaves on memory allocation error.

Returns

A unique command id for asynchronous completion

4.12.3.24 **virtual PVCommandId PVAuthorEngineInterface::Start (const OsclAny * aContextData = NULL) [pure virtual]**

Start the authoring session.

pvAuthor Engine will begin to receive source data, encode them to the specified format and quality, and send the output data to the specified data sinks. This function is valid only in the PVAE_STATE_INITIALIZED state.

Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_RECORDING state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

4.12.3.25 **virtual PVCommandId PVAuthorEngineInterface::Stop (const OsclAny * aContextData = NULL) [pure virtual]**

Stops an authoring session.

The authoring session will be stopped and pvAuthor Engine will stop receiving source data from the data sources, and no further encoded data will be sent to the data sinks. This function is valid only in the PVAE_STATE_RECORDING and PVAE_STATE_PAUSED states.

Upon completion of this command, pvAuthor Engine will be in PVAE_STATE_INITIALIZED state.

Parameters

aContextData Optional opaque data to be passed back to user with the command response

Returns

A unique command id for asynchronous completion

Public Member Functions

- virtual void [CommandCompleted](#) (const [PVCmdResponse](#) &aResponse)=0
- virtual [~PVCommandStatusObserver](#) ()

4.14.1 Detailed Description

[PVCommandStatusObserver](#) Class

[PVCommandStatusObserver](#) is the PV SDK observer class for notifying the status of issued command messages. The API provides a mechanism for the status of each command to be passed back along with context specific information where applicable. Applications using the PV SDKs must have a class derived from [PVCommandStatusObserver](#) and implement the pure virtual function in order to receive event notifications from a PV SDK. Additional information is optionally provided via derived classes.

Data Fields

- int32 [iAsyncEventType](#)

4.16.1 Detailed Description

[PVEngineAsyncEvent](#) Class

[PVEngineAsyncEvent](#) class is a data class to hold asynchronous events generated by the engine. The class is meant to be used inside the engine and not exposed to the interface layer or above.

4.16.2 Constructor & Destructor Documentation

4.16.2.1 PVEngineAsyncEvent::PVEngineAsyncEvent (int32 aAsyncEventType) [inline]

The constructor for [PVEngineCommand](#) which allows the data values to be set.

Parameters

aCmdType The command type value for this command. The value is an engine-specific 32-bit value.

aCmdId The command ID assigned by the engine for this command.

aContextData The pointer to the passed-in context data for this command.

Returns

None

4.16.2.2 PVEngineAsyncEvent::PVEngineAsyncEvent (const PVEngineAsyncEvent &aAsyncEvent) [inline]

The copy constructor for [PVEngineAsyncEvent](#). Used mainly for `Oscl_Vector`.

Parameters

aAsyncEvent The reference to the source [PVEngineAsyncEvent](#) to copy the data values from.

Returns

None

References [iAsyncEventType](#).

4.16.3 Member Function Documentation

4.16.3.1 `int32 PVEngineAsyncEvent::GetAsyncEventType () const [inline]`

This function returns the stored asynchronous event type value.

Returns

The signed 32-bit event type value.

References `iAsyncEventType`.

4.16.4 Field Documentation

4.16.4.1 `int32 PVEngineAsyncEvent::iAsyncEventType`

Referenced by `GetAsyncEventType()`, and `PVEngineAsyncEvent()`.
